

Amendments to the Abstract

In a support arrangement for a rear trunk lid of a convertible vehicle supported on a vehicle body so as to be selectively pivotable about a front pivot joint and a rear pivot joint, releasable trunk lid locking ~~means~~ structures are provided at both ends of the trunk lid for selectively locking the front or rear end to the respective pivot joint and a control element is provided for operating the releasable locking ~~means~~ structures in such a way that, upon locking of the front pivot joint, a rear actuator connected between the trunk lid and the vehicle body is moved into a non-functional position in which it is disengaged from the vehicle body and, upon unlocking of the front pivot joint, the rear actuator is moved to a functional position, in which it is engaged with the vehicle body.
